

Office 365 Single Sign-on and Directory Synchronization as a service

Vis365 Suite

The only AD synchronization solution on the market that

- Is fail-safe and works even if your local AD is temporarily offline
- Requires no server installations
- Keeps on premise AD and Office 365 synchronized but independent
- Offers most flexible AD synchronization
- Encrypts all data transfers and requires no incoming open firewall ports
- Consists of 2 products (VisFed365 and VisSync365) that can be used separately or together

VisFed365

- Robust Single-Sign-On (SSO) solution for all Office 365 services
- Replaces on-premise Microsoft Active Directory Federation Services (ADFS) installation
- Secure and fail-safe – no single point of failure

VisFed365 sets up a trust relationship between your AD and Office 365. This trust is mediated by servers that we operate in Windows Azure, Microsoft's Enterprise Cloud service, saving you the trouble and effort of purchasing, installing, and operating a local server cluster to provide fail-safe logon services to your users in-house and on the road. VisFed365 caches logon information of users as

irreversibly encrypted hashes in Windows Azure, guaranteeing a robust and fail-safe SSO solution even if your IT infrastructure is temporarily unavailable.

VisFed365 only requires a one-time installation of a small Windows application anywhere in your local network (we recommended Windows Server 2008 or later). By installing it on several hosts, it provides automatic load balancing for logon services.

VisSync365

- Flexible synchronization of any local AD objects with Office 365
- Keeps Office 365 AD independent from local AD and fully writable
- Fast, real-time synchronization based on selected Organizational Units, groups etc.
- Replaces on-premise Microsoft DirSync installation

VisSync365 saves you the trouble of creating user accounts and editing their properties locally as well as in Office 365. Any type of local AD objects can be automatically synchronized with Office 365. Besides, it also saves you the trouble of installing any local servers for this purpose. User accounts in Office 365 may be licensed automatically. While Microsoft DirSync converts synchronized Office 365 objects to read-only, VisSync365 keeps your local AD and Office 365 independent from each other. This ensures that you can edit or create Office 365 objects (such as secondary mail aliases, resource calendars, etc.) that are not available in your local AD.
